

CNSD's Possible Cause and Cure

Our bodies have an innate ability to know what it needs normally. In abnormal cases we usually see deficiencies or recognize something new and unusual. Such as with, altered Blood Counts or visible cancer cells. We have found making the body recognize what toxins it needs to fight can also permit the body to help heal itself as it is designed to do in most normal cases. Such alterations by medical treatments can be the most effective treatment even for Cancer Patients with certain forms of Cancer. Our bodies have an innate ability to fight basic issues; as well as letting us know what chemicals we need to assist it in proper operations such as with our body craving certain foods. Normally when our bodies lack chemicals like potassium or zinc. We will crave foods like bananas, to compensate for our deficiencies. The food may even taste slightly metallic, as our body absorbs what it needs from the food. When our bodies require Iron or Protein, we crave Red Meats. The other side to this though. When we take in adverse chemicals, our body has adverse reactions. Our bodies also have the ability to inform us of things that are harmful to it, like when we find ourselves feeling nausea from a certain food; as well as the body trying to clean itself from toxins by releasing them via vomiting or giving us loose bowels. If we ingest a toxic plant, it has been known to cause one to vomit. This may happen If any undesirable bacteria or ingredient is ingested. The stomach and bowel will try to flush the contaminants, to prevent absorption. Our body's natural reactions should also be included in our understanding during our studies to cure issues.

If our body is attacking itself, we must ask ourselves why?

Chemical Neurotransmitters can be altered by chemicals. Not everyone reacts to the same chemicals in the same way.

Calcium, a nontoxic, is known to be found in our body. Calcium is usually a good thing; it is good for bones. Yet, we find Calcium attached to Central nervous system tissues. Doctors in study papers have admitted that "although they have no proof, they think it is a good thing for our bodies." We can't simply assume it is a "good thing", especially knowing we have no proof as to why this would be a positive factor in our bodies. We only know that Calcium attached to CNS Tissues is common and consistent within human bodies. We do not currently understand the effects of Calcium attached to CNS Tissues or if the relationship is a "Good" one. We do not know of any positive interactions that this relationship might provide for our body. We know that high Calcium content found in our blood or urine known as hypercalcemia is a bad thing. We certainly know that our bodies can absorb and alter chemicals they absorb. If Calcium is attached to Central Nervous System Tissues, why wouldn't the Blood Vessels absorb the Calcium? So, we can't outright rule out that it is possible there is a negative interaction from the relationship of Calcium being attached to CNS Tissues. There are certain people whose bodies absorb this Calcium, and those are the group of people we are focused on helping. What if CNSDs is just another instance of the body knowing what it doesn't need or of what is harming it? If Calcium absorption by CNS Tissues shouldn't happen, yet it is being permitted, would the body not try to compensate for that in different ways?

My ex-wife is "Lactose Intolerant." We know this by her body's natural reaction to Milk. What if it isn't just Lactose her body reacts to. Her body may be reacting, as if it is allergic to the Lactose in Milk. Yet, what if it is an adverse reaction to the Calcium in the Milk? As Calcium builds up around CNS Tissues over time, and if the CNS Tissue is permitted to absorb more of the Calcium with time as well, that combination of events could certainly explain why CNSDs get increasingly worse over time also. The effects would absolutely increase the reaction from a body overtime, causing the symptoms to get increasingly worse over time if it goes untreated.

If Central Nervous System Issues have a commonality, and we know that they do, if only by the common symptoms associated by the different types of CNSDs. Those diagnosed with most CNSDs also being found to be Lactose Intolerant should all show low Calcium levels. That certainly would be a signaling factor for further study into Calcium being the cause of CNSDs. I know I can't look at the patient data to answer such a question myself. I can only speculate about what is possible by looking at my ex-wife's symptoms associated with her medical diagnosis. If it is a Toxic-Reactive relationship we see with most CNSDs, if all or most individuals with CNSDs like Fibromyalgia, RA, or Lupis where the body is attacking Calcium such as in the joints, is viewed as a Toxic-Reactive Response. A toxic reaction to Milk would also be a further example of such a causal factor from the absorption of Calcium by a CNS. If that is the case, I believe known Calcium reducers used in other CNSD treatments such as Hypoglycemia could be a safe testing method to pursue if such testing is needed. I say that even though the individuals show signs of low Calcium as their body fights to remove Calcium from itself, as the body continues trying to cure itself. Unfortunately, our current treatment by giving patients Calcium Pills is doctors know to do now. Hyperglycemia is the opposite of a Toxic-Reaction to absorbed Calcium by CNS Tissue. Hyperglycemia is also another known adverse body condition caused by the CNS. However, Hypoglycemia is a different side of CNSD's, as sometimes in rare cases, our body "gets it wrong" when fighting to fix itself. Hypoglycemia can be described as the 'Diabetic-Reaction' by a human body in certain people, as the body is producing more Calcium as a reaction to too much Calcium being in the CNS. We must note that while treating Hyperglycemia, as we reduce the bodies Calcium, we chemically produce the same effects found as symptoms in most of the other Central Nervous System Disorders, as the body attacks Bone Joints causing pain and inflammation in the surrounding Soft Tissues.

The most practical "next step" would be to discover what prevents the absorption of the adverse Calcium. By that, we need to understand what chemical or element is missing from the CNS's is for those affected by CNSDs.

Due to my studies of the topic, I have come to believe that there is a missing yet previously overlooked element from the CNS in those affected by CNSDs. This element being missing is permitting the effected CNSs to absorb the Calcium that is altering the composure of the Neurons and their ability to properly relay electrical signals. My studies have caused me to believe that the missing chemical or element is actually a Heavy Element as they are highly conductive permitting them to improve electrical transmissions even within a body, such as with electrical signals being sent through the Brain, CNS, and Nerves.

Although there was not much in the way of medical publications with information that could be located during my studies on the topic. I decided to open myself up to all known information that could be found on the topic, here is what I found while searching for the CNSD cure. In the early to mid-20th Century, there was an individual named Edgar Cayce. If you are not familiar with the man's work, I will try to quickly explain him to you. Edgar Cayce had issues with his speech and while pursuing a cure he was put under Hypnoses. While hypnotized his speech became "normal" and further discoveries were made. It was discovered that while hypnotized he could be asked questions about subjects he shouldn't have an answer for, yet he could answer them with incredible accuracy. One example being, he was asked how to cure a woman who was showing signs of a mental illness. He informed them that she had a tooth that was pressing on a nerve causing her issues. They removed the tooth that Edgar spoke of, and the woman was immediately cured of her afflictions. Edgar Cayce referred to his hypnotization as being put into a trance that permitted him to access the "Akashic Record" expressed as a Universal Knowledge of all things. Edgar's wife learned how to Hypnotize him, and he continued to let her do so for many years as he answered questions to help people with many different topics and issues until his death. Edgar Cayce's "predictions" have been proven to be approximately 90% accurate, primarily as they could neither prove nor disprove all for them to give him a 100% accuracy account. Edgar Cayce was asked what the cure for MS was. Edgar gave his answer as this, "We will know the cure for MS when we learn how to get the body to absorb Gold".

There are only 2 chemicals or items I can tell you that will corrode / dissolve Gold. The first Chemical is Sulfuric Acid and in no way could ever be put into our body without extreme adverse effects. The second Chemical is actually a Heavy Metal Element. This Heavy Metal is readily absorbed by our body. When our body absorbs this Heavy Metal, it first attaches itself to the CNS where we would want it to go for treatment of CNSDs. However, if we get too much of this Heavy Metal it will begin to build up in our Brain causing adverse effects. This Heavy Metal is found naturally in our food, and it therefore becomes an inadvertent part of a standard healthy diet. Yet not all people readily consume the food item and could easily be deficient from having this Heavy Element in their systems. The Heavy Element I speak of is Mercury, and we get it naturally into our body by eating Fish.

Patients consuming Fish Oil Pills still will not get Mercury into their systems, until doctors are prescribing it to them. We already know what amount of Mercury is permissible in the human body as well as how much can be harmful to the human body. My suggestion would be through testing to discover the best way to administer Mercury to those who do not get it naturally. Begin treatments by administering the maximum permitted amount of Mercury in a human body to study if improvements are made. I believe that the progression of

CNSDs into the severity of MS is highly possibly caused due to the Calcification of CNS's Tissues deterioration and damage caused by the absorption of Calcium.

As we know, Calcification is caused by Calcium that has built up in the blood. When this happens, it can cause organ tissues to get hard and brittle as they lose elasticity. Such an occurrence in nerve tissue could certainly cause the pain associated with those who have CNSD's, it could also cause the nerve tissue to deteriorate like those who have the more severe CNSD known as MS. Currently even with MS, doctors have written in their research papers that "Calcium is known to be a contributor", but they do not yet see it as the cause.

Current CNSD Treatments include Chemo Infusion that are designed to reduce the CNS's ability to function. By depleting the CNS's ability to function properly, it is unable to attack the body as it tries to attack the Calcium inside of it. However, the treatment also removes Heavy Metals like Mercury from the body. As such, an individual cannot begin treatments without consulting with their doctor to ensure that treatment of symptoms is not removing the Cure as it is being administered to the patient.
