Amyotrophic Lateral Sclerosis “ALS” – Lou Gehrig’s Disease

Cause and Cure

A disease that attacks the Brain Stem of individuals. As the Brain Stem the pathway between a brain and the Spine/Central Nervous System begins to deteriorate and die. Individuals begin to lose Motor Skills and Function, as Electrical Signals from the Brain fail to make their way to extremities. Once progression has continued enough the Brain Stem that controls Heart and Respiratory Systems for the Body stop.

What is it?

5-15% of the cases seem to be a Genetic Marker for increased probability of getting it.

90% are “Completely Random” cases, although they all have been in US Military Service. Not random.

There is a Medicine that only US Service Members are required and permitted to take. The medication has been Black Labeled by the FDA since Vietnam. The Malaria Pill attacks the Brain Stem and can cause PTSD due to damage with associated Night Terrors, without a combat experience to trigger. Once finished taking the Cycle of Pills, the next set of Pills is to Flush the Liver as it will die if the medicine is not removed from the body. Only Us Service Members who are being sent into a Malaria Environment are required to take the Pills. Military Readiness is far mor important than Force number reductions by an illness.

Yet, it seems the Medicine does not get out of the System. As it continues to affect the Brain Stems Blood Vessels reducing Blood Flow and causing the Brin Stem to Die. Or does the US Government and Doctors have a different Theory?

100% Preventable.

Can we Treat it though?

I know I was given the pills on more than one occasion, 50-70 average Military Member Age is? How long does it take to kill our Brain?

Here is how the US Government can and will fix this issue!

A Vaccine is to be administered prior to infection. Treatments are to be given after infection. The Malaria Pill that was being administered wrong by the US Government is a Treatment for infection, not a Vaccine. So administered prior to infection, when did the infection happen, and how far into the treatment schedule? Infection after will have it not in the blood, yet it will still be present in the affected organs, like Brain Stem and the Liver. Treatment of infection must be given as US Service members leave the infection zone. This is to remove the Malaria from infected organs. ALS / Lou Gehrig's Disease is Late Onset Severe Malaria; the 3rd Treatment Emergency drug is required with immediate hospitalization to treat. You must flush our System's properly and at the correct time after infection for now on.

All Service members who were given the Malaria pills prior to entering a Malaria Environment need to visit their VA Health Providers to get checked. MRI to determine current damage, and a new round of Treatment to remove the Malaria from organs.
